

# Haiti Animal Rabies Surveillance Program

Haiti has the highest burden of human rabies deaths in the Americas. In 2013, CDC began working closely with the Haitian Ministry of Agriculture, Natural Resources, and Rural Development to initiate the **Haiti Animal Rabies Surveillance Program (HARSP)** -- a cost-effective intervention to reduce human rabies deaths using a multidisciplinary strategy.

HARSP employs six key components that work together to increase detection of rabies cases and prevent transmission to humans.

## HARSP is Improving Rabies Surveillance Capacity in Haiti and Saving Lives

Since the successful implementation of HARSP in 2013, Haiti has become a global leader in rabies control with the aim to eliminate the disease by 2023.

1.2 million dogs vaccinated

Over 350,000 health professionals and community members reached with rabies education

24-fold increase in case-detection

Risk of dying from rabies decreased by 60% in HARSP communities

395 rabid dogs removed from the community preventing an estimated 2,500 human exposures
